

# Telemedicine on the front lines

The “golden hour” is a time when lives can be saved with appropriate medical action. The TransportAV™ allows doctors to be at the forefront of patient care. Instant access to the specialized knowledge of an emergency room physician is now available via the TransportAV from GlobalMedia! Such access can mean the difference between life and death. Now, GlobalMedia is helping connect ER doctors with the first responders who are on the front lines of patient care. An emergency transport team worked with GlobalMedia to design the TransportAV and improve patient care from the minute the ambulance arrives on scene.

## Better care, sooner

Mounted to an ambulance gurney, the TransportAV allows trauma physicians and staff to be more efficient. The system allows physicians and sub-specialists to quickly examine patients and make critical decisions in a short amount of time. The TransportAV allows a physician to participate in the care of a patient in the back of an ambulance - before it has arrived at the hospital! A patient in transit can have rapid access to a doctor whose expertise can make the difference in saving a life.

## Increased efficiency

The TransportAV allows first responders to seek input from a specialist who can help provide the correct level of care sooner. This reduces the potential need to move a patient out of your facility's care. The TransportAV also allows the appropriate protocols at the hospital to be activated before a patient arrives - increasing the efficiency of busy ER staffs.

Specific models and configurations are also available to fit any need. Call GlobalMedia's Telemedicine Design Team to determine how the TransportAV can work for you!
